

Phase 2

Core Requirements & Design

Date	26.06.2026
Team ID	NIL
Project Name	Software Installation Request Automation
Maximum Marks	4

Requirements Analysis & Solution Design

Introduction

Phase 2 translates the ideation phase into concrete system requirements within ServiceNow. We define the specific data fields, variables, and process flows necessary for the Software Installation Request catalog item.

Customer Journey Map

The journey transitions from the user searching the Service Portal, filling out the structured form, receiving an automated 'Awaiting Approval' notification, to final fulfillment.

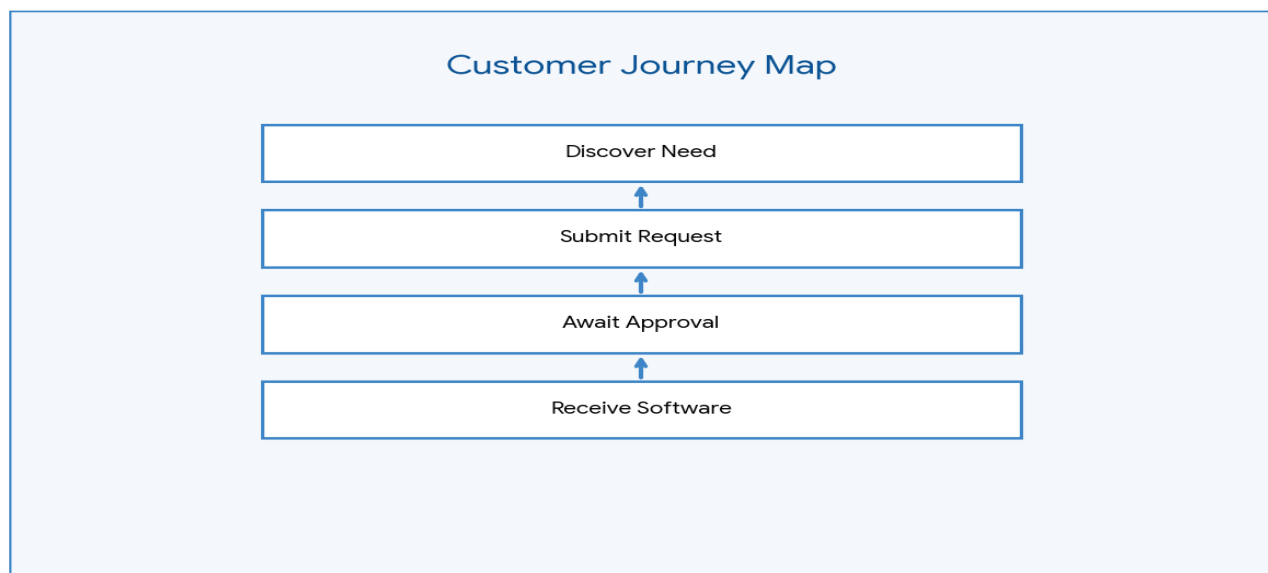

Figure: Customer Journey Map

Functional Requirements

1. A Catalog Item named 'Software Installation Request'. 2. Four distinct variables (Software Name, Version, Justification, Urgency). 3. Automated routing to the 'Software Support' group for approval.

Non-Functional Requirements

The system must be highly available, maintain strict role-based access control (only approved managers can approve), and ensure fast load times on the Service Portal.

Epic vs User Stories

Epic: Automate Software Provisioning. User Story 1: As a user, I want a form to select my software. User Story 2: As a manager, I want to approve requests with one click.

Requirement Traceability

Each requirement maps directly to a ServiceNow component. R1 (Form) -> sc_cat_item. R2 (Approvals) -> Flow Designer. R3 (Exception) -> Business Rule.

Data Flow Diagram Level 0

Shows the high-level flow of data from the User (inputs variables) -> ServiceNow System (processes logic) -> IT Fulfillment (receives SCTASK).

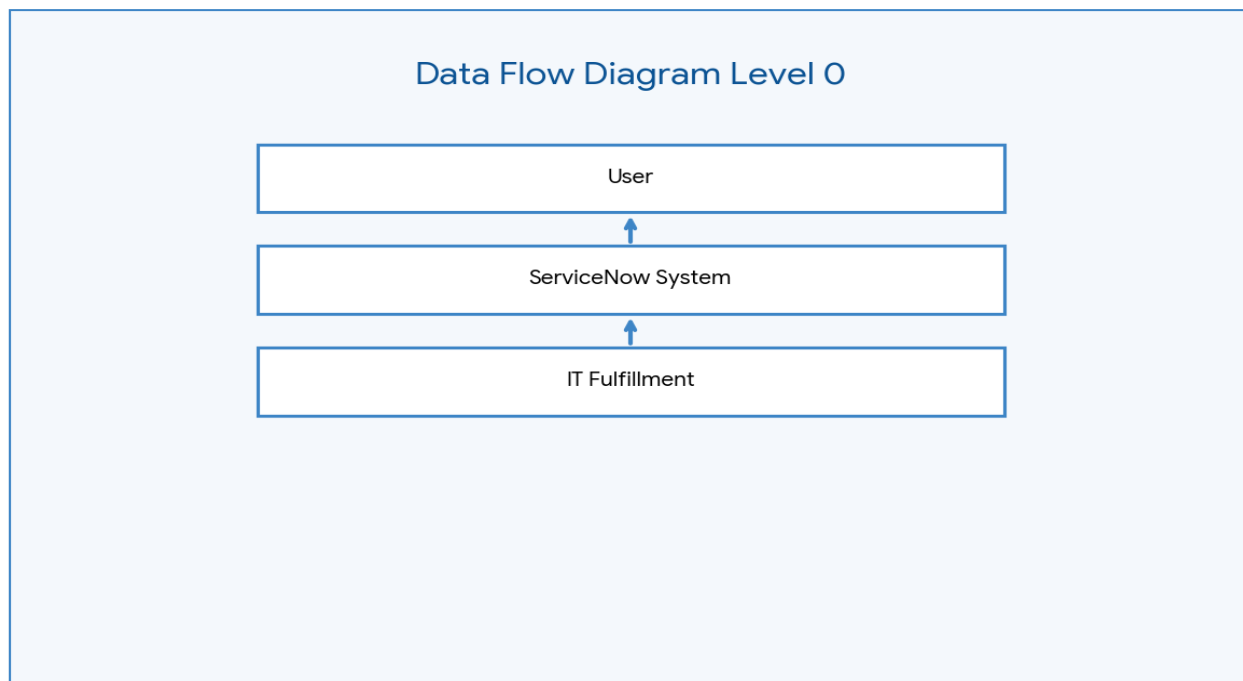

Figure: DFD Level 0

Data Flow Diagram Level 1

Details the specific table interactions: sc_req_item receives the submission, triggers sysapproval_approver, which cascades to sc_task.

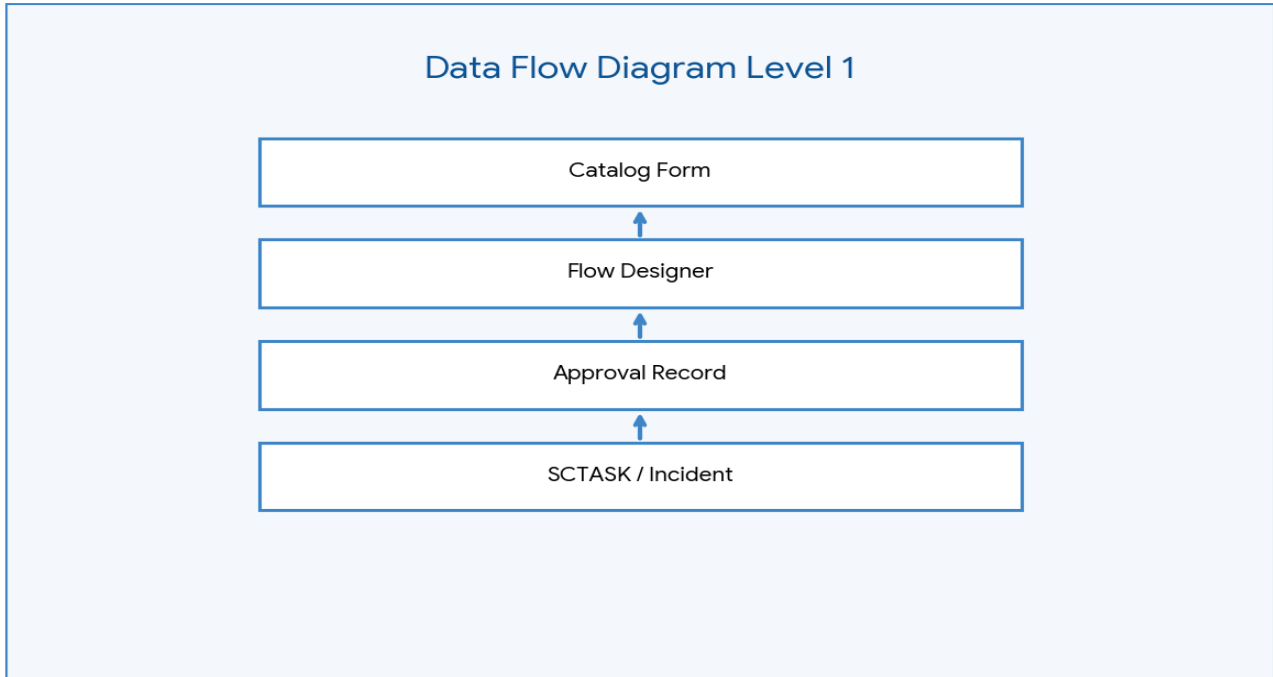

Figure: DFD Level 1

Use Case Diagram

Illustrates actors (User, Manager, IT Agent) and their specific interactions with the ServiceNow application.

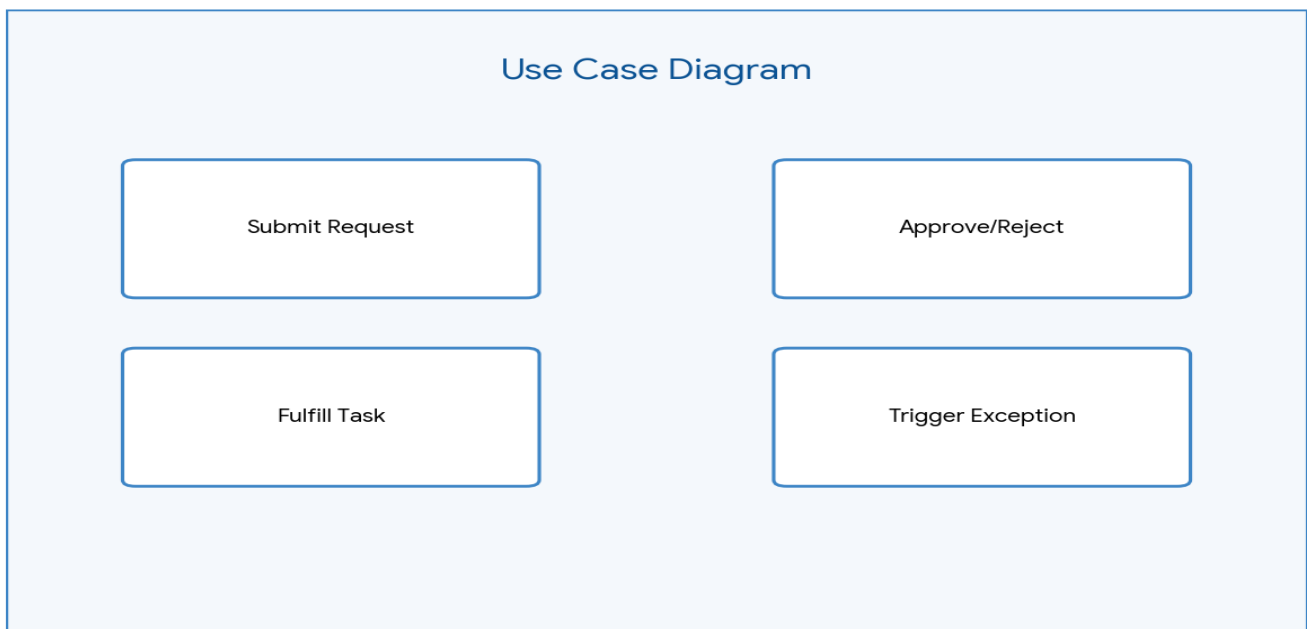

Figure: Use Case Diagram

User Story Mapping

Organizes stories by release priority. MVP includes the basic form and Flow Designer. V2 includes the Business Rule exception handling.

Figure: User Story Map

Acceptance Criteria

The system must generate a REQ, a linked RITM, pause for Approval, generate an SCTASK upon approval, and close the RITM when the task is closed.

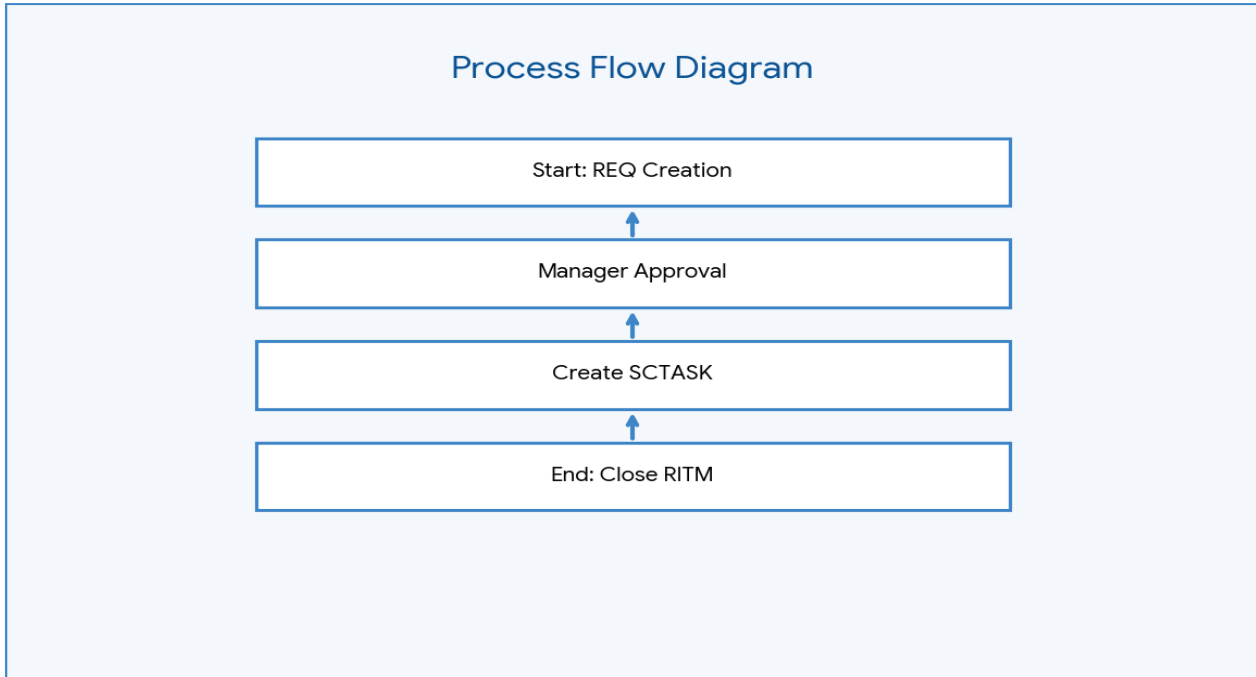

Figure: Process Flow Diagram

Release Planning

Release 1.0 will deploy the Scoped Application containing the Catalog Item, Variables, and the primary Flow Designer logic.

Phase Summary

Phase 2 established the structural blueprint. The variables (software_name, version_required, license_justification, urgency) and logic flow are now ready for technical implementation.

Name	Short description	Active	Category
Software Installation Request	Software Installation Request	true	Software
Network_Requests		true	Network
Network Request	Network request Management	true	Network Services
Network Port Activation		true	Network Services
New LAN Connection		true	Network Services
Network Troubleshooting Request		true	Network Services
Firewall Change Request		true	Network Services
Wi-Fi Access Request		true	Network Services
VPN Access Request		true	Network Services
og1	what rey?	true	Software
